

Uniform Distribution

The most basic of all the continuous random variables is the uniform random variable, which is equally likely to take on any value in its range (α, β) . X is a *uniform random variable* ($X \sim \text{Uni}(\alpha, \beta)$) if it has PDF:

$$f(x) = \begin{cases} \frac{1}{\beta - \alpha} & \text{when } \alpha \leq x \leq \beta \\ 0 & \text{otherwise} \end{cases}$$

Notice how the density $1/(\beta - \alpha)$ is exactly the same regardless of the value for x . That makes the density uniform. So why is the PDF $1/(\beta - \alpha)$ and not 1? That is the constant that makes it such that the integral over all possible inputs evaluates to 1.

Uniform Random Variable

Notation: $X \sim \text{Uni}(\alpha, \beta)$

Description: A continuous random variable that takes on values, with equal likelihood, between α and β

Parameters: $\alpha \in \mathbb{R}$, the minimum value of the variable.
 $\beta \in \mathbb{R}$, $\beta > \alpha$, the maximum value of the variable.

Support: $x \in [\alpha, \beta]$

PDF equation: $f(x) = \begin{cases} \frac{1}{\beta - \alpha} & \text{for } x \in [\alpha, \beta] \\ 0 & \text{else} \end{cases}$

CDF equation: $F(x) = \begin{cases} \frac{x - \alpha}{\beta - \alpha} & \text{for } x \in [\alpha, \beta] \\ 0 & \text{for } x < \alpha \\ 1 & \text{for } x > \beta \end{cases}$

Expectation: $E[X] = \frac{1}{2}(\alpha + \beta)$

Variance: $\text{Var}(X) = \frac{1}{12}(\beta - \alpha)^2$

PDF graph:

Parameter α : Parameter β :

Example: You are running to the bus stop. You don't know exactly when the bus arrives. You believe all times between 2 and 2:30 are equally likely. You show up at 2:15pm. What is $P(\text{wait} < 5 \text{ minutes})$?

Let T be the time, in minutes after 2pm that the bus arrives. Because we think that all times are equally likely in this range, $T \sim \text{Uni}(\alpha = 0, \beta = 30)$. The probability that you wait 5 minutes is equal to the probability that the bus shows up between 2:15 and 2:20. In other words $P(15 < T < 20)$:

$$P(\text{Wait under 5 mins}) = P(15 < T < 20)$$

$$= \int_{15}^{20} f_T(x) \partial x$$

$$= \int_{15}^{20} \frac{1}{\beta - \alpha} \partial x$$

$$= \frac{1}{30} \partial x$$

$$= \left. \frac{x}{30} \right|_{15}^{20}$$

$$= \frac{20}{30} - \frac{15}{30} = \frac{5}{30}$$

We can come up with a closed form for the probability that a uniform random variable X is in the range a to b , assuming that $\alpha \leq a \leq b \leq \beta$:

$$P(a \leq X \leq b) = \int_a^b f(x) dx$$

$$= \int_a^b \frac{1}{\beta - \alpha} dx$$

$$= \frac{b - a}{\beta - \alpha}$$
